REPLACED MOT ART 34 ANO 01/02515

## CLAIMS

1. Method of operating a compression ignition engine on a fuel consisting of an alcohol and/or ether with water, by injecting the fuel into the combustion chamber of the engine and combusting the fuel with air, wherein the air for combustion of the fuel is preheated to a temperature of at least 60°C.

- An oxygenated diesel fuel composition sustainable 2. for use in compression ignition internal combustion engines, comprising methanol, dimethylether and water, where the conversion of methanol is 50-95% and wherein the mole ratio between dimethylether and water is 1; this fuel composition is generated on board a vehicle by catalytic dehydration of methanol according to Fig. 2; the generated fuel composition is used as main fuel for the engine and are injected into a prechamber or directly into the cylinder(s) of the engine; the dehydration temperature is between 200°C and 450°C; the dehydrogenation pressure is from 10 to 400 bar; the dehydrogenation catalyst is heated by heat exchange with the exhaust gas. Inlet air to the engine is heated to between 60°C and 200°C, preferably between 100°C and 150°C by heat exchange with the exhaust gas.
- 3. A fuel composition according to claim 2, wherein the methanol used for dehydration contains from 0 to 20 w/w% of water, and, consequently, results in a dehydrogenated fuel composition where added water displaces the ratio between dimethylether and water generated from the methanol dehydrogenation and to the amount of water added.

WO 01/02515 PCT/EP00/05275

25

- A fuel composition according to claim 2, wherein the methanol used for dehydrogenation contains from 0 to 20 w/w% of ethanol or higher alcohol, and, consequently, displaces the amount of added higher alcohol with the resulting ethers, unconverted alcohol and CO-generated water by the dehydrogenation.
- 5. A fuel composition according to claim 2, where methanol used for dehydration contains water according to claim 3 and ethanol plus higher alcohol according to claim 4.

5

6. Use of neat of crude methanol according to anyone of claim 1 to 5, but utilised in ships, trains or in stationary diesel engines for power and heat supply.

International Patent Application No. PCT/EP00/05275 Haldor Topsøe A/S PCT 1182-00957 May 18, 2001

## **NEW CLAIMS 1 TO 5**

and 400 bar.

1. A process of preparing an oxygenated diesel fuel composition sustainable for use in compression ignition internal combustion engines, comprising methanol, dimethyl ether and water, comprising the step of converting methanol containing up to 20% w/w of water and up to 20% w/w of ethanol or higher alcohol in a catalytic dehydration reaction, the methanol being converted to dimethyl ether according to the reaction scheme:

2 CH₃OH ⇔ DME + water,
using a catalytic converter on board of a vehicle, wherein the dehydration
temperature is between 200°C and 450°C and wherein the pressure is between 10

- 2. A method of operating a compression ignition engine on a fuel obtainable by the process of claim 1, by injecting the fuel into the combustion chamber of the engine and combusting the fuel with air, wherein the concentration of methanol is between 5 and 50% w/w and wherein the air for combustion is preheated to a temperature of at least 60°C.
- 3. The method of claim 2, wherein the combustion air is preheated to a temperature of at least 100°C.
- 4. The method of claim 2, wherein the combustion air is preheated by exchange with the exhaust gas.
- 5. The method of claim 2 applied to vehicles, ships, trains or in stationary diesel engines for power and heat supply.
